

Asymptotic Notation :

1. Big O Notation

2. Omega Notation

3. Theta Notation

Big O Notation(very very important used everywhere) : upper bound of an algorithm

$f(n) = O(g(n))$, if $f(n) \leq cg(n)$ for all n , $n \geq n_0$ such that there exists two positive constants where $c > 0$ and $n_0 \geq 1$

So, if we say $a = O(b)$ meaning is (b greater than a after taking c help)

Problem 1 :

$$f(n) = 5n$$

$$g(n) = n$$

$$f(n) = O(g(n)), \text{ it means } f(n) \leq c \cdot (g(n))$$

$$5n \leq c \cdot n \text{ for all } n, n \geq 1$$

$$c = 5 \quad 5n \leq 5n$$

$$f(n) = O(g(n))$$

now what should be the value of a constant "c"?

5

Problem 2 :

$$f(n) = n^2$$

$$g(n) = n$$

$f(n) = O(g(n))$, it means $f(n) \leq cg(n)$ (Mathematical definition) $n^2 \leq c.n$ for all $n, n \geq 1$ -----> equation 1

now what should be the value of constant "c"?

$c = n$ // Is this a constant -> not at all because here c depends on the value of nbigger the value of n , bigger the value of c and smaller the value of n , smaller the value of c .

$$c = 3 \quad 4 \quad 6$$

$$n^2 \leq n^2$$

$f(n)$ is not equal to $O(g(n))$

Increasing order of complexities :

- 1. Constant Complexity : $O(1)$**
- 2. Logarithmic Complexity : $O(\log_n)$**
- 3. Linear Complexity : $O(n)$**
- 4. Quadratic Complexity : $O(n^2)$**
- 5. Cubic Complexity : $O(n^3)$**

6. Polynomial Complexity : $O(n^c)$; where c is constant

7. Exponential Complexity : $O(c^n)$; where c is constant

8. $n! < n^n$

$$2^n < n^n$$

$$n! > 2^n$$

$$2^n < n! < n^n$$

OR

$$2^n = O(n!) ; n! = O(n^n)$$

Complexity Graph(Focus very carefully)

Omega Notation :

Let $f(n) = \omega(g(n))$ if and only if $f(n) \geq c(g(n))$ for all $n, n \geq n_0$ such that there exists two positive constants $c > 0$ and $n_0 \geq 1$.

Problem 1 :

$$f(n) = n \quad g(n) = 5n$$

$$f(n) = \omega(g(n))$$

What should be the value of c ?

$$f(n) \geq c(g(n))$$

$$n \geq c \cdot 5n$$

$$c = 1/5 - \text{constant}$$

$$f(n) = \omega(g(n))$$

Problem 2 :

$$f(n) = 5n \quad g(n) = n$$

$$f(n) = \omega(g(n))$$

What should be the value of c ?

$$f(n) \geq c \cdot \omega(g(n))$$

$$5n \geq c \cdot n$$

$$c = 1 \Rightarrow 5n \geq 1 \cdot n$$

$$f(n) = \omega(g(n))$$

Problem 3 :

$$f(n) = n^2 \quad g(n) = n^2 + n + 10$$

$$f(n) = \omega(g(n))$$

What should be the value of c ?

$$f(n) \geq c \cdot g(n)$$

$$n^2 \geq c \cdot (n^2 + n + 10)$$

$$c = 1/2$$

$$n^2 \geq 1/2(n^2 + n + 10)$$

$$f(n) = \omega(g(n))$$

Problem 4 :

$$f(n) = n \quad g(n) = n^2$$

$$f(n) = \omega(g(n))$$

What should be the value of c ?

$$f(n) \geq g(n)$$

$$n \geq c \cdot n^2$$

$c = 1/n \rightarrow$ means it is not a constant

That's why $f(n)$ is not equal to $\omega(g(n))$.

- Theta Notation : which satisfies both bigO and omega

Let $f(n) = \theta(g(n))$ if and only if $f(n) \geq c_1 g(n)$ (omega) **and** $f(n) \leq c_2 g(n)$ (Big O) for all n ; $n \geq n_0$ such that there exists three constants.

$$c_1 > 0$$

$$c_2 > 0$$

$$n_0 \geq 1$$

Problem 1 :

$$f(n) = n \quad g(n) = 5n$$

$$f(n) = \theta(g(n))$$

$$1. \text{ Omega} \rightarrow f(n) \geq c \cdot g(n)$$

$$n \geq c \cdot 5n$$

$$c = 1/5 - \text{constant}$$

$$f(n) = \omega(g(n))$$

$$2. \text{ Big O} \rightarrow f(n) \leq c \cdot g(n)$$

$$n \leq c \cdot 5n$$

$$c = 1 - \text{constant}$$

$$f(n) = O(g(n))$$

Thus because $f(n)$ holds true for both omega as well as O, thus $f(n) = \theta(g(n))$

Problem 2 :

$$f(n) = n - 10 \quad g(n) = n + 10$$

$$f(n) = \theta(g(n))$$

$$1. \text{ Omega } \rightarrow f(n) \geq c \cdot g(n)$$

$$n - 10 \geq c \cdot (n + 10)$$

$$c = 1/2 - \text{constant}$$

$$f(n) = \omega(g(n))$$

$$2. \text{ Big O } \rightarrow f(n) \leq c \cdot g(n)$$

$$n - 10 \leq c \cdot (n + 10)$$

$$c = 1$$

$$f(n) = O(g(n))$$

We can say that $f(n) = \theta(g(n))$ as it holds true for both omega as well as big O.

Problem 3 :

$$f(n) = n \quad g(n) = n$$

$$f(n) = \theta(g(n))$$

$$1. \text{ Omega } \rightarrow f(n) \geq c \cdot g(n)$$

$$n \geq c \cdot n$$

$$c = 1 - \text{constant}$$

$$\text{Thus, } f(n) = \omega(g(n))$$

$$2. \text{ Big O } \rightarrow f(n) \leq c \cdot g(n)$$

$$n \leq c \cdot n$$

$c = 1$ - constant

Thus, $f(n) = O(g(n))$

And thus $f(n) = \theta(g(n))$ as it holds true for both omega and Big

O

Problem 4 :

$f(n) = n$ $g(n) = n^2$

$f(n) = \theta(g(n))$

1. Omega $\rightarrow f(n) \geq c \cdot g(n)$

$n \geq c \cdot n^2$

$c = 1/n$ - Not a constant

$f(n)$ is not $\theta(g(n))$
